opacity protein opaB - Neisseria meningitidis (isolate 21213) (fragment)
C;Species: Neisseria meningitidis
A;Variety; isolate 21213
C;Date: 13-Jan-1995 #sequence_revision 24-Oct-1997 #text_change 09-Jul-2004
C;Accession: 844709
Mol. Microbiol. 12, 171-180, 1994
A;Title: Microbiol. 12, 171-180, 1994
A;Title: Microevolution within a clonal population of pathogenic bacteria: recombination
A;Reference number: $44705; MUID:94335637; PMID:7520117
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A;Cross-references: UNIPROT:051089; EMBL:U03409; NID:g432174; PIDN:AAA61550.1; PID:g4321 A;Experimental source: isolate Z1213; strain serogroup A; clone pFLOB2510 A;Note: expression of opacity proteins is regulated by the number of translated repeat e of repeats place the start codon in frame with the rest of the protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   C;Accession: AD0935

Nucleotide sequences that hybridise to huRAD cDNA - method for isolating human checkpoint cDNA, and antibody to CDC34.

Example 4; Col 89-96; 73pp; English.

This sequence is the yeast MEC2 protein. The DNA encoding this sequence is necessary for \$2/M cell cycle checkpoint control. This sequence was identified using the method of the invention for isolating a human checkpoint cDNA that is capable of restoring growth at a restrictive temperature in a yeast test cell, where the yeast test cell comprises a genome having a first gene that forms a DNA strand break at a restrictive temperature and a second gene that fails to induce a cell cycle arrest in response to the DNA strand break, whereby the growth of the yeast test

Example 4; Col 85-90; 54pp; English.

```
cell is inhibited at the restrictive temperature, comprising: (a) obtaining a human cDNA library comprising several human cDNA clones individually into plasmid vectors containing a selectable marker gene; (c) transforming a culture of the yeast test cells with the plasmid vectors from the preceding step; (d) selecting for yeast test cells transformed with the selectable marker gene; (e) growing the selected transformed with the selectable marker temperature and isolating a candidate transformant capable of growing at the restrictive temperature; and (f) identifying the human cDNA carried by the candidate cransformant and determining that the human cDNA arried by the candidate transformant and determining that the human cDNA is less than 50% homologous with both the first gene and the human cDNA is less than 50% homologous with both the first gene and than the property of the proper
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WTFGRNPACDYHLGNISRLSNKHFQILLGEDGNLLLNDISTNGTWLNGGKVEKNSNQLLS 125

This protein is encoded by novel yeast checkpoint control gene MEC2 (see AAT91040). Yeast checkpoint control genes RAD17, RAD24, MEC1, MEC2 and AAT91040). Yeast checkpoint control genes RAD17, RAD24, MEC1, MEC2 and MEC3 (AAT91037-41, respectively) are responsible for recognising if the cell has suffered DNA damage in the form of radiation or chemical damage or if the cell has failed to complete DNA replication because of chemical inhibition or intrinsic error. Upon recognising damage or failure, the genes are responsible for inhibiting mitosis. The purpose of this checkpoint control is that it preserves the viability of the cell and the integrity of the genome by providing the cell time to repair these cinsults prior to undertaking mitosis. The genes are potentially useful in developing cancer chemotherapeutics, cancer chemoprevention agents, and environmental toxicology tests. They can be used to produce proteins (see AAM26661-65) that can then be screened for chemical agents that would interfere with checkpoint controls. Cloned genes can also be used to develop yeast strains in which these genes are deleted. Such yeast strains can then be used to find the homologous human genes (see AAT91034 516). (Updated on 25-MAR-2003 to correct PF field.)

The invention relates to multiprotein complexes from eukaryotes. Proteins of the invention and DNA sequences encoding them are given in records ABR52568-ABR53903 and ACC6010-ACC61944 respectively. The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful
The present sequence is the protein sequence of Saccharomyces cerevisiae PSFX1, a protein related to human tyrosine threomine kinase (TTK, see ABP5438). TTK polymucleotides and polypeptides of the invention encompass polymucleotides and polypeptides having sequence similarity or esquence identity to human TTK and other genes and gene products related to TTK, such as SPK1. The invention is based on the finding that TTK is differentially expressed in various forms of cancer. It provides methods colon cancer cells, by detection of expression levels of TTK, as well as diagnostic, prognostic and therapeutic methods. These methods can be used as the basis of rational therapy. Assays for identifying molecules that modulate the activity of these genes in cancers, as well as methods of inhibiting tumour growth by inhibiting the activity of TTK are also
                                                                                                                                                                                                                                                                                                                                                                                                66 WIFGRNPACDYHLGNISRLSNKHFQILLGEDGNLLLNDISTWGTWLNGQKVEKNSNQLLS 125

a subject, comprising comparing the expression levels of tyrosine threonine kinase (TTK, a mitotic checkpoint gene) polypeptide or polynchototide in a test cell obtained from the subject and in a normal non-cancer cell, where an increase in the expression level of TTK protein or nucleic acid in the test cell compared to that in the normal cell, and in the test cell compared to that in the normal cell, are reducing growth of a cancerous cell (by contacting a cancerous cell with an amount of an agent effective to reduce TTK polypeptide activity in the cell), an assay for identifying a candidate agent that reduces growth of a cancerous cell (TTK polypeptide activity of a TTK polypeptide in the presence of a candidate agent; and (ii) comparing
for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office. The invention relates to novel protein complexes comprising a first and a second protein, or its derivative, fragment, homologue or variant. The proteins are selected from given protein complexes, which are not defined in the specification. The variants are encoded by nucleic acids that hybridize to the nucleic acids encoding the proteins under low stringency conditions. The protein complexes are useful as targets for an active agent of a pharmaceutical. These protein complexes are particularly useful as drugs targets for the treatment or preventing of a disease or disorder. The complexes and methods above are useful in diagnosing or screening for the presence of a disease or disorder or a predisposition for developing a disease or disorder in subject. These are also useful in screening for a drug for treatment or prevention of a disease or disorder. The molecule that modulates the amount, activity or protein components of the complex is useful for the manufacture of a medicament or prevention of a disease or disorder. This sequence corresponds to a protein of the invention. (Note: the sequence data for this patent did not form part of the printed specification but was obtained from the EPO in electronic format).

```
the activity of TTK polypeptide in the presence of a candidate agent relative to TTK polypeptide activity in the absence of the candidate agent, identifying an agent that reduces TTK activity (comprising: (i) contacting a cancerous call displaying elevated expression of a TTK-encoding polynucleotide with a candidate agent; and (ii) determining the effect of the candidate agent on TTK polypeptide activity) and assessing the prognosis of a cancerous disease other than ovarian cancer in a subject (comprising: (i) detecting expression of TTK -encoding comparing a comparisation of TTK-encoding polynucleotide in the test cancer cell of expression of TTK-encoding polynucleotide in the test cancer cell with a level of expression of the polynucleotide in a control noncarcer cell, where the level of expression of TTK in the test cancer cell with a level of expression of TTK in the centrol noncarcer cell, where the level of expression of TTK in the cancer cell is indicative of the prognosis of the cancercus disease). The methods are cellulative of the prognosis of the cancercus disease). The methods are reducing growth of cancercus cells, identifying a candidate agent that reduces TTK activity and assessing the prognosis of a cancercus disease other than concert. The methods are also useful for determining the ability of a subject to respond to a particular therapy e.g. as a basis of rational therapy. The present sequence represents a closely related compared to prognosis of a subject is the prognosis of a cancercus and a cancercus of a subject to respond to a particular therapy e.g. as a basis of protein to human TTK, in this case yeast SPKI (not defined)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 WIFGRNPACDYHLGNISRLSNKHFQI-LXXXXXXLLNDISTNGTWLNGQKVEKNSNQLLS 59

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by recombination, of a promoter replacement fragment with a heterologous promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells having both alleles modified are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene
The present sequence is a protein which is essential for the survival and growth of Candida albicans. This fungus causes infection, such as vulvovaginitis, in humans, particularly in those who are immunocompromised. The protein and its gene can be used to diagnose infection, and they can be used as targets for inhibiting the proliferation of the fungus. This protein and gene are particularly useful as they are thought to be species-specific
                                                                                                                                                                                           Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                            1 WIFGRNPACDYHLGNISRLSNKHFQI-LXXXXXXL-LNDISINGTWLNGQKVEKNSNQLL

```
that contributes to the resistance of a diploid fungus to an antifungal agent, an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian disease. (Mi) is useful for identifying a compound which modulates the activity of a gene product, preferably enzymatic activity, carbon compound catabolism, biosynthetic, transporter, transcriptional, translational, signal transduction, DNA replication and cell division activity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans calls and for treating infection by C. albicans. The present sequence is that of an essential candida ablicans protein used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                28
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cold tolerance; heat tolerance; drought tolerance; herbicide; osmosis; pathogen tolerance; pest tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Recombinant DNA construct; transformed plant; improved plant property;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 WIFGRNPACDYHLGNISRLSNKHFQI-LXXXXXXL-LNDISTNGTWLNGOKVEKNSNQLL

```

```
The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant as a crop plant such as maize or soybean. The method of producing a transformed plant the such as maize or soybean. The method of producing a plant is a crop plant such as maize or soybean. The method of producing a plant with the naving an improved property comprises transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties. The recombinant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of combination improved ylath by modification of carbohydrate, nitrogen or property property in property in property property property property plant property plant growth regulators, increased rate of content, improved ylath by modification of carbohydrate, nitrogen or property property plant property plant property plant property plant property plant property plant growth regulators, increased rate of content, improved ylath by modification of carbohydrate, nitrogen or property property plant property plant plant property plant plant property plant plant property plant property plant pl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   providing improved plant growth and development under at least one stress condition, improved lighin production or improved galactomannan production. This sequence represents a bacterial polypoptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              119 RNDSDESENVVFLHGKSKGLKNLLKSSASSTFSNNFRHSSNGTFLNFVSESLIRLQFTDV 178

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention aloc relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant the cardinant DNA construct and growing the transformed plant with the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for improved plant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved jield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by production, improved lignin production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the
                                                                                                                                                                                                                      New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          78 GRSNTCNYQLLQFT-ASYKHFRVYSVLIDDDMDPLVYCEDQSSNGTFLNHRLIGKGNSVL 136
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    57
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at segdata.uspto.gov/sequence.html.
